

Patient Observation Camera

Command Projects' Patient Observation Camera is specifically designed to allow staff in the CT control room to closely monitor patient physical appearance during a scan sequence via a 24" wall-mounted monitor on an adjustable arm allowing for optimal viewability.

Our IP camera requires only a single cat 6 cable to be installed and the entire system can be run from a single power point located within the control room, leading to a quick and efficient install.

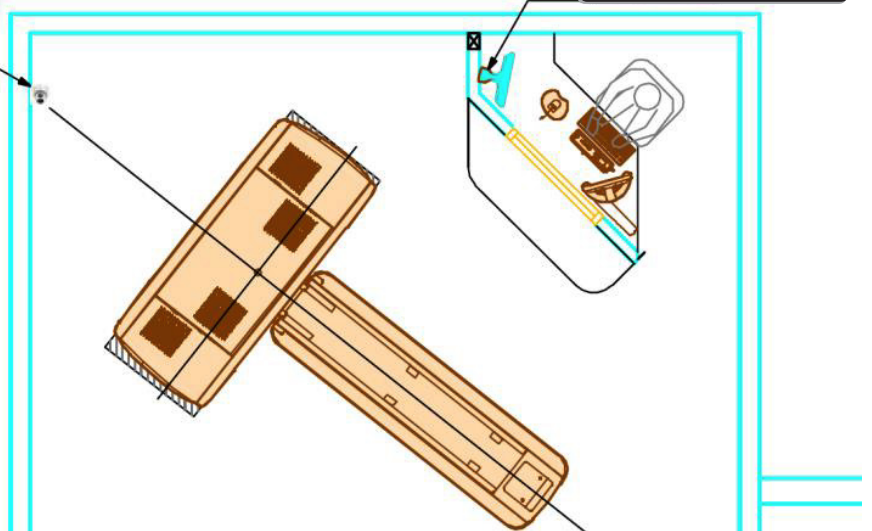

The system allows for upgrades with the option of extra cameras or HDD for recording functionality.

24inch Patient Observation Monitor

5MP night & day mode camera
